

Module 1 – Python Basics

Lesson 2 – Input & Output

Interview Definition

Input is used to take data from the user. Output is used to display data to the user.

Java

```
import java.util.Scanner;

Scanner sc = new Scanner(System.in);
String name = sc.nextLine();
System.out.println(name);
```

Python

```
name = input()
print(name)
```

Interview Takeaways

- Output: Java uses `System.out.println()`, Python uses `print()`.
- Input: Java uses `Scanner`, Python uses `input()`.
- `input()` always returns a string. Convert it using `int()` or `float()` when needed.

Examples

```
age = int(input())
salary = float(input())
```

Interview Tip

A common interview question is: What does `input()` return? Answer: It always returns a string.

Quiz

Q1. Which function is used to take input in Python?

Answer: `input()`

Q2. Which function is used to display output in Python?

Answer: `print()`

Q3. What is the default data type returned by `input()`?

Answer: String
