

Module 1 – Python Basics

Lesson 3 – Operators

Interview Definition

Operators are symbols used to perform operations on variables and values.

Java

```
int a = 10;
int b = 5;

System.out.println(a + b);
System.out.println(a - b);
System.out.println(a * b);
System.out.println(a / b);
System.out.println(a % b);
```

Python

```
a = 10
b = 5

print(a + b)
print(a - b)
print(a * b)
print(a / b)
print(a % b)
```

Interview Takeaways

- Arithmetic operators are the same in Java and Python (+, -, *, /, %).
- In Python, / always returns a float.
- Use // for integer (floor) division.
- % returns the remainder and is commonly used to check even/odd numbers.

Examples

```
print(10 / 5)    # 2.0
print(10 // 5)   # 2
print(10 % 3)    # 1
```

Interview Tip

Remember: / returns a float, while // performs integer (floor) division.

Quiz

What is the output of print(10 / 2)?

Answer: 5.0

What is the output of print(10 // 2)?

Answer: 5

What is the output of print(10 % 3)?

Answer: 1
